Here is your finalized, comprehensive master blueprint for **FloorballKenya.com**. This layout synthesizes your original vision with the technical, financial, and legal protections needed to maintain 100% ownership while scaling lean as a student entrepreneur.

FloorballKenya.com — Complete Project Blueprint

A Strategic Tech Blueprint for a 3rd-Year University Project & Startup

1. Executive Summary

FloorballKenya.com is designed to be the central digital infrastructure for the sport of floorball in Kenya. By integrating a dynamic tournament/league database with a decentralized **multi-vendor e-commerce marketplace**, the platform

three primary friction points of the sport locally: low awareness, fragmented league coordination, and lack of affordable equipment.
Instead of operating as a traditional online shop requiring massive upfront capital for inventory, FloorballKenya.com operates on a lean **Platform-as-a-Service (PaaS)** model. You retain 100% intellectual property ownership while monetizing the platform through league transaction cuts, vendor commissions, and corporate digital branding.

2. Problem & Opportunity

- **The Problem:** Floorball is growing rapidly in Kenyan universities and schools, but growth is crippled by an opaque ecosystem. Equipment (sticks, lightweight balls, goalie gear) is nearly impossible to find in standard brick-and-mortar sports shops. Meanwhile,

match schedules, player statistics, and league standings are tracked manually on paper or scattered WhatsApp groups, making it unattractive to corporate sponsors.

- The Opportunity: There is zero digital competition. By building the definitive database and portal for the sport, you establish a digital monopoly. You leverage your technical skills and insider knowledge as a club captain to build a barrier to entry that standard software development agencies cannot easily copy.

3. Target Market & Value Proposition

Target Market

- Primary: Educational institutions (Secondary schools and universities running sports programs), active club players (ages 12–25),

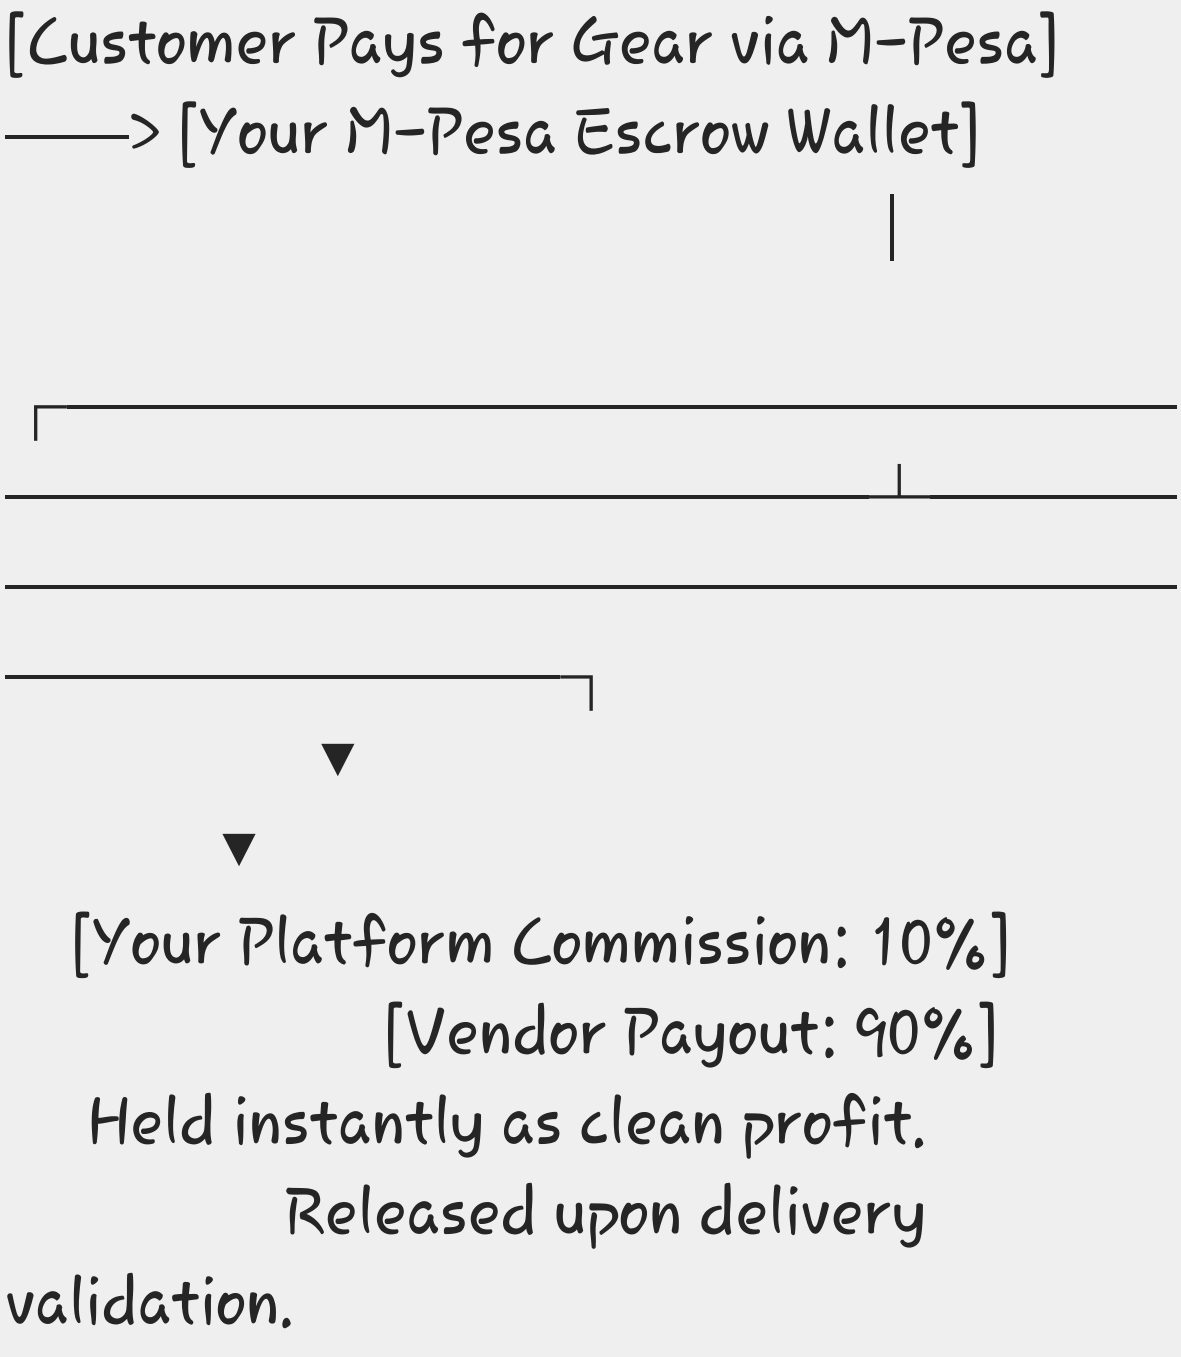

- Secondary: Adult recreational players, corporate team-building organizers, and regional sports coordinators in East Africa.

Value Proposition

A unified, mobile-first ecosystem where the community can check verified, real-time match statistics and standings while seamlessly purchasing verified equipment from independent vendors through a trusted local payment gateway.

4. The Multi-Vendor Marketplace Architecture

To eliminate the need for heavy startup capital, the e-commerce engine functions as a decentralized marketplace (the Jumia model).

The Vendor Verification Lifecycle

1. **Onboarding Vetting:** Independent sports merchants, private importers, or international

2. The Escrow Safety Net: Customer payments made via M-Pesa go directly into your central business wallet first. Funds are held in escrow and are only released to the vendor's phone number or bank account minus your commission once the buyer confirms safe delivery. This protects your platform's brand reputation from scams.

5. Business & Monetization Model

The platform avoids relying on a single revenue stream, distributing its financial health across multiple logical channels:

- Marketplace Sales Commission (10% - 12%): A flat fee collected on every floorball stick, ball, jersey, or accessory sold through the site.
- Automated League Registration Cut (5% - 10%): All official club and school league

registration fees are routed through the platform's payment gateway. The system auto-deducts a "technology facilitation fee" before forwarding the remainder to the federation.

- **Premium Team Dashboards:** Individual clubs pay a seasonal subscription fee (e.g., KSh 1,500 per season) to access advanced team profiles, comprehensive player career statistics, and digital transfer logs useful for scouting.
- **Corporate Digital Branding:** Tailored sponsorship slots, home-page banner takeovers, and tournament naming rights (e.g., "The [Sponsor Name] Elite Cup") managed directly through your administrative portal.

6. Technical Implementation & "Code

- The Tech Stack: WordPress + WooCommerce running a dedicated multi-vendor core engine (such as Dokan or WCFM Marketplace). This allows you to deploy a highly secure, functional marketplace within weeks.
- Payment Layer: Direct integration with Safaricom's Daraja M-Pesa API using a dedicated WooCommerce integration plugin to handle immediate checkouts and escrow hold-backs.
- The Data Lock-in (Your Moat): While your frontend theme can easily be cloned by a competitor, your relational database architecture cannot. By housing years of verified historical match data, player tracking, and school athletic contacts, your platform becomes irreplaceable to the ecosystem.

Budget

Because you are building the software yourself, your development costs are effectively zero. Your initial capital is reserved entirely for deployment infrastructure and ground-level logistics.

Initial Startup Budget (KSh)

- **Domain Registration (.com):** KSh 1,200 (Annual)
- **Premium Web Hosting:** KSh 4,500 (Annual package with staging environments)
- **eCitizen Business Registration:** KSh 950 (Official Business Name registration)
- **M-Pesa API Integration Plugin:** KSh 3,500 (Pre-built secure gateway connector)
- **Ground Logistics & Communication:** KSh 5,000 (Transport for vendor and federation meetings)

Monthly Operational Overhead

- **Internet Data Bundles:** KSh 2,000
- **Social Media Marketing & Content Boosting:** KSh 1,500
- **Total Monthly Maintenance:KSh 3,500**

Break-Even Forecast

With a total initial overhead of roughly KSh 15,000, the platform is designed to reach net-profit status by **Month 3**, assuming operations coincide with an active tournament cycle. Selling just 8 mid-range floorball sticks via the marketplace (generating KSh 4,000 in commission) and processing a single tournament registration for 12 teams (generating KSh 12,000 in tech fees) fully clears your startup investment.

Matrix

Identified Vulnerability	Risk Level	Active Technical & Operational Mitigation
The WhatsApp Bypass (Users cutting out the platform to avoid commission)	High	Do not rely solely on the transaction. Bundle platform sales with value-adds like a platform-backed 1-month warranty or free entrance

		passes to the next local tournament.
Federation Stagnation (FFK failing to organize active leagues)	Medium	Decouple the software from the federation's timeline. Build the database to host and manage independent/ private corporate cups alongside official league tables.

Supply Chain Gaps (Lack of local physical inventory in stores)	High	Sidestep generic sports shops initially. Target individual club players and private importers who already bring gear into Kenya through the International Floorball Federation (IFF).
Low Code Barriers	Medium	Aggressively focus on data

(Competitors trying to copy the layout)		retention. Own the historical statistics, individual player career metrics, and official digital player cards. Code can be copied; historical data records cannot.

9. Legal Ownership Framework

To protect your creation if a major corporate sponsor or the federation funds the execution, you must establish clear legal boundaries under

Kenyan Copyright Act (Cap 130) .

The Golden Rule: Never structure the deal as a development contract or a "work-for-hire". Instead, frame the arrangement as a Strategic Sponsorship and Licensing Agreement.

Critical Legal Pillars

1. IP Retention Clause: The contract must explicitly state that all source code, database schemas, user account registries, designs, and domain names remain the exclusive property of the developer. The funding organization is explicitly purchasing *branding real estate*, not software code.
2. The Marketing License Model: Grant the sponsor a limited, renewable license to be the "Official Presenting Partner" for a fixed timeline (e.g., 24 months). If they fail to renew or underpay down the line, you retain

the right to strip their branding and sell the digital real estate to a competing organization.

3. **Data Controller Status:** Under the **Kenya Data Protection Act**, your entity must remain the official Data Controller. The sponsor receives high-level marketing data reports (e.g., traffic metrics, user demographics), but never the raw, private database entries of your users.
4. **Technical Uptime Protection:** Keep all master Git repositories private under your personal developer accounts. Always retain the root administrative credentials for the hosting environment and domain registrar.

10. Execution Roadmap

```
MONTHS 1-2: Planning & MVP Build
  ├── Register FloorballKenya.com
```

partnership Memorandum of Understanding (MOU).
  └──── Build the WordPress core with Multi-Vendor and M-Pesa Daraja API layers.

MONTHS 3-6: Soft Launch & Market Entry
  ├──── Onboard the first 3 niche equipment importers as verified marketplace vendors.
  ├──── Digitally host a small local tournament to stress-test registration and data tracking.
  └──── Begin heavy organic content production across TikTok and Instagram Reels.

MONTHS 6-12: Scale & Monetization
  ├──── Launch the complete automated league engine for the schools/universities calendar.
  ├──── Secure the first corporate digital title sponsor using active traffic statistics.

└——— Reinvest marketplace profits into direct wholesale equipment importation.
